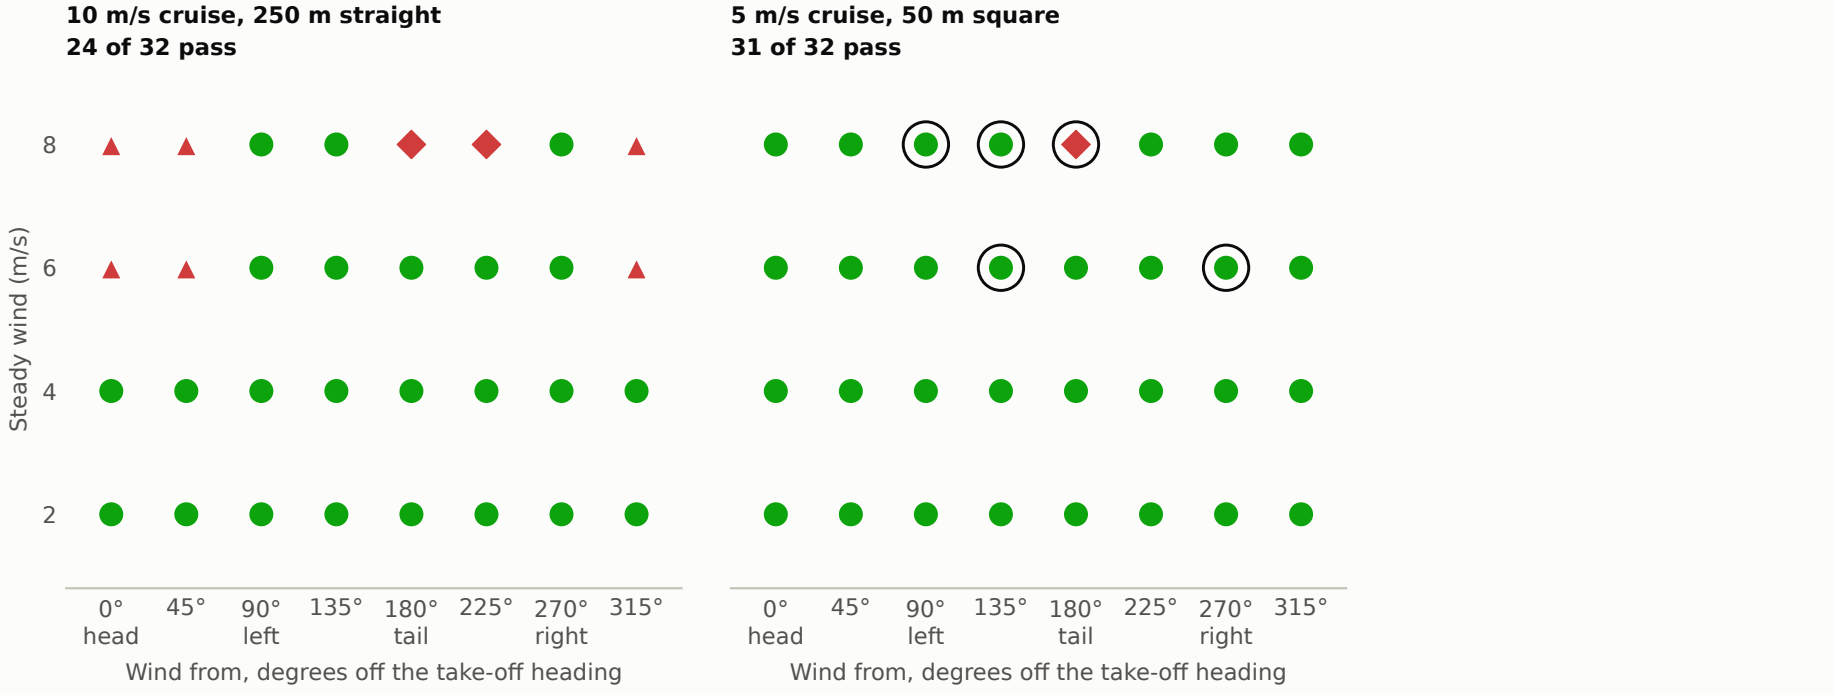
Flying slower handles more of the strong wind: at 6–8 m/s, 8 of 16 cases pass at 10 m/s cruise, 15 of 16 at 5 m/s cruise

Each mark is one full simulated flight in a steady wind (firm heading hold). Direction is measured from the nose at take-off; on the square the vehicle meets the wind from all four sides once per lap.



PX4 v1.17.0 SITL with Gazebo and assumed vehicle coefficients; simulation, not flight data.
