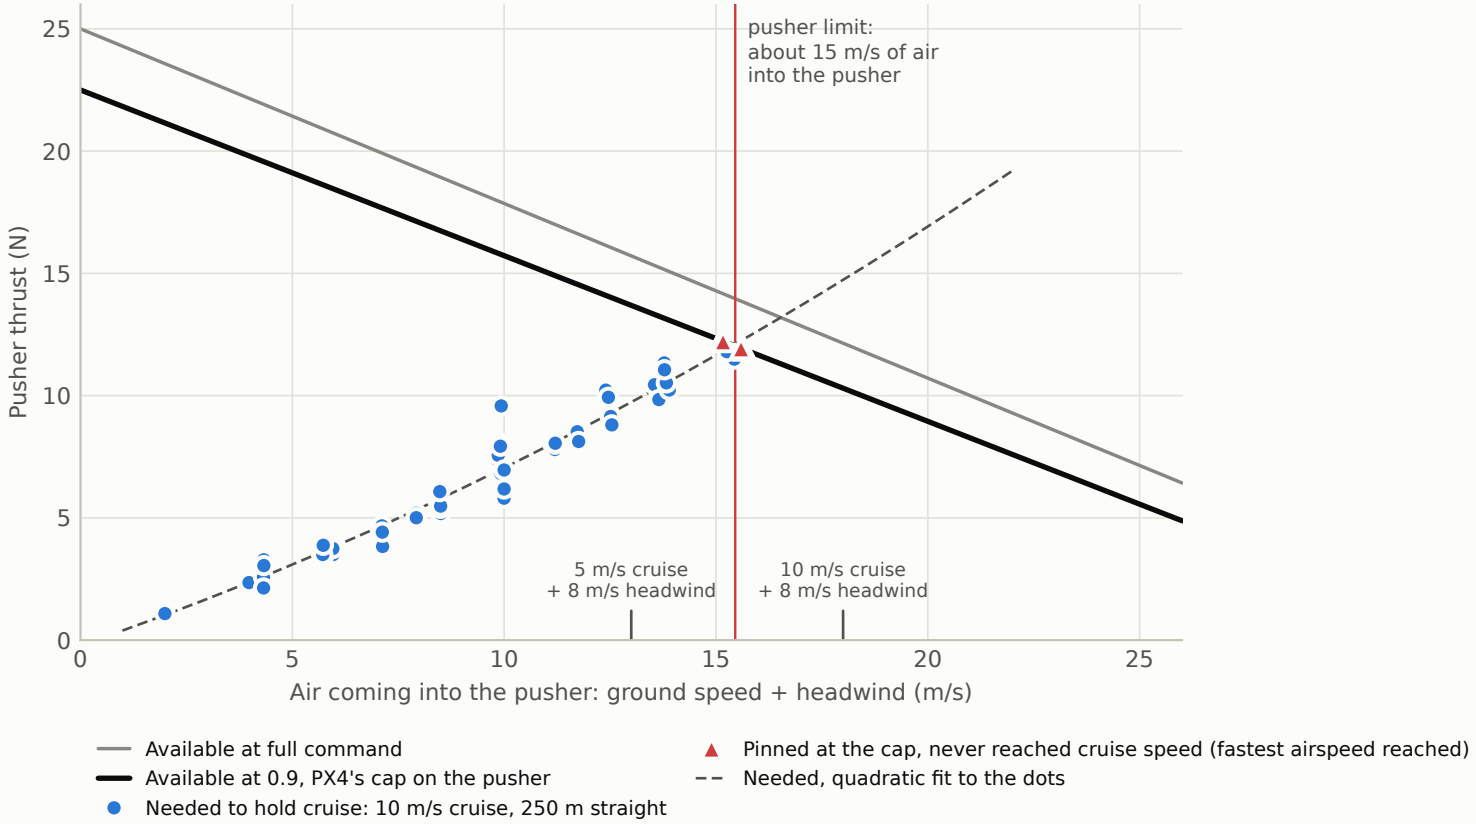
In a headwind the pusher runs out at about 15 m/s of airspeed

The 25 N pusher gives less as the air comes in faster (none at 35 m/s at full speed). Each dot is one simulated flight in a steady wind: the thrust PX4 used to hold cruise, from its pusher command and the same model. Straight flights only (10 m/s cruise, 250 m straight).



PX4 v1.17.0 SITL with Gazebo and assumed vehicle coefficients; simulation, not flight data. Battery sag (under 2% here) is ignored.
