Wind and the pusher use up the most margin; every landing takes a large share of the touchdown limit

Each row is one flight with one value at the low or high end of its range (10 m/s straight mission). A cell shows how much of that check's pass limit the flight used; red cells went past it. Numbers only from half the limit up. Touchdown speed used 46% to 105% of its limit (64% nominal), so rows are ranked by the other checks. 19 more cases stayed within 5 points of the nominal and are not shown.

PX4 v1.17.0 SITL with Gazebo and assumed vehicle coefficients; simulation, not flight data.
