Easing into the braking lowers the nose-up from 7.2° to 5.4° and lets the pusher fade out

Every slow-down of the 50 m square at 5 m/s, no wind, each run flown with no other simulation on the machine.
The eased braking takes longer (7.9 s instead of 5 s from 5 m/s) and is never harder than the old one.

PX4 v1.17.0 SITL with Gazebo and assumed vehicle coefficients; simulation, not flight data.
