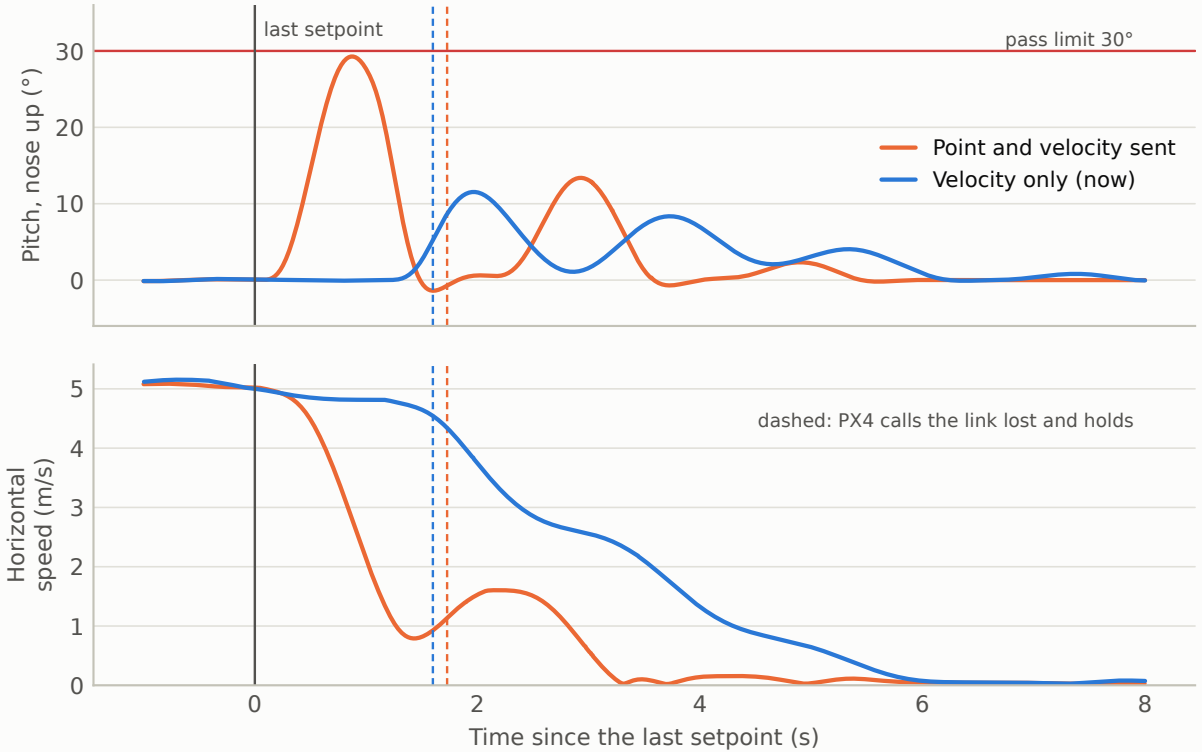
When the Jetson goes silent at 5 m/s, the last setpoint decides: 29° nose-up with its point in it, 12° without

The 50 m square, no wind; the setpoints stop 1.5 s into the second leg. PX4 calls the link lost after 1 s (COM_OF_LOSS_T) and holds. Until then it flies the last setpoint: with a point, it brakes back to a point already passed; with only a velocity, it flies on.



PX4 v1.17.0 SITL with Gazebo and assumed vehicle coefficients; simulation, not flight data.
